

# Concept 9 - Classifying Triangles

**Goals:** Classify triangles by side and angle

---

Write these definitions in your note-taking guide:

## Classifying Triangles by Angle Measure

**ACUTE :** all three angles are acute

**OBTUSE :** has one obtuse angle

**RIGHT :** has one right angle

**EQUIANGULAR :** all 3 angles are congruent

# Classifying Triangles by Side Length

**SCALENE** : no sides are congruent

**ISOSCELES** : at least 2 sides congruent

**EQUILATERAL** : all 3 sides congruent

Every triangle has 2 classifications - 1 to describe the sides and 1 to describe the angles.

Isosceles  
Acute

Scalene  
Right

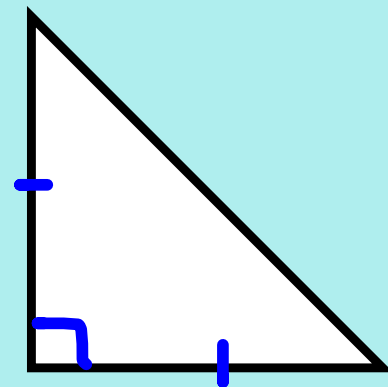

Scalene  
Obtuse

Equilateral  
Equiangular

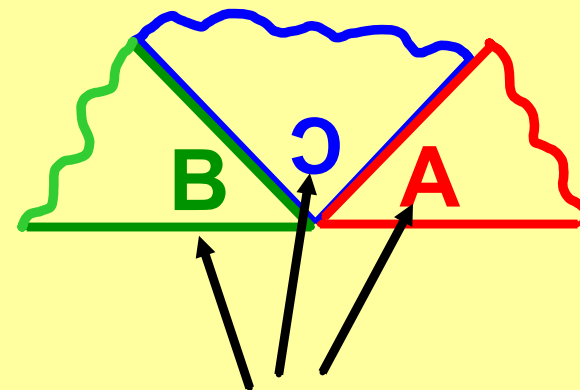

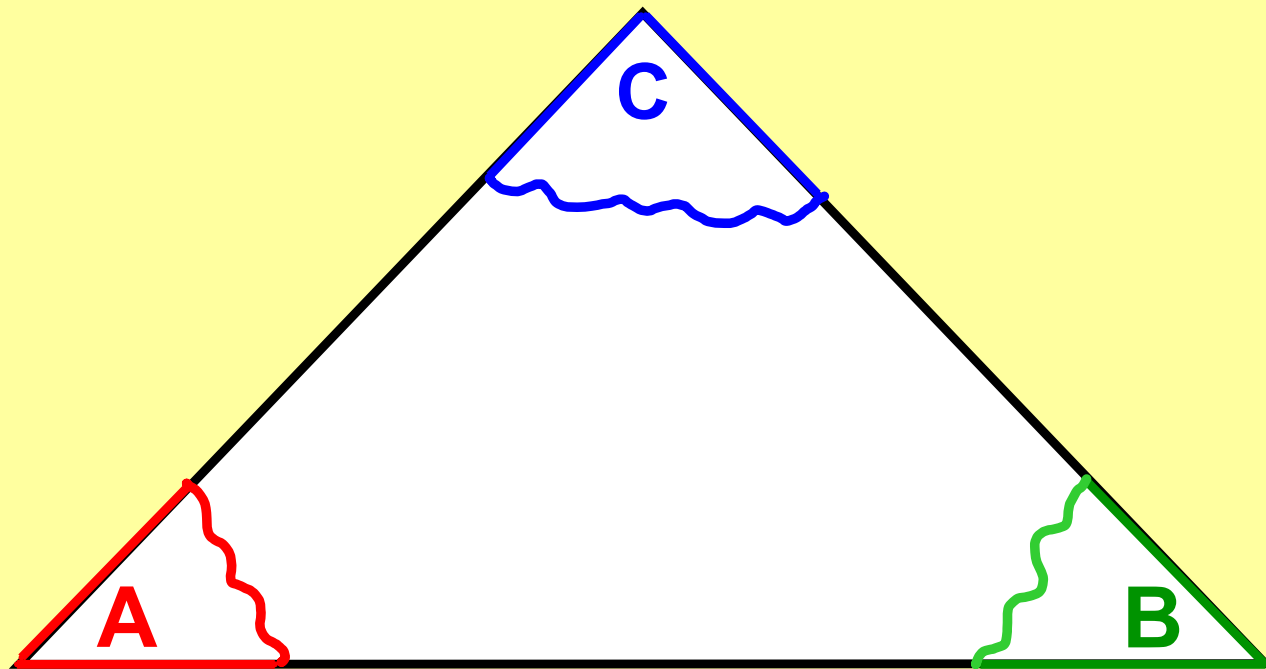

Isosceles  
Obtuse

Isosceles  
Right

## Triangle Angle-Sum Theorem

The sum of the measures of the interior angles of a triangle is 180 degrees.

the 3 angles of a triangle always add up to 180 degrees

Find the value of the variable.

Add up the two angles you have already, then subtract from 180.

$$\begin{aligned}90 + 27 &= 117 \\180 - 117 &= 63 \\x &= 63 \text{ degrees}\end{aligned}$$

$$\begin{aligned}85 + 47 &= 132 \\180 - 132 &= 48 \\y &= 48 \text{ degrees}\end{aligned}$$

**Assignment:**

**Concept 9 Worksheet - due Friday 11/1**  
(front side)

Classify each triangle by its sides (scalene, isosceles, or equilateral) and by its angles (acute, equiangular, obtuse, or right).

Scalene  
Right

Identify one of each indicated triangle in the diagram to the right.

7. right

8. obtuse

9. acute

10. equilateral

Find the measure of each numbered angle
